memory usage: 107.3+ KB

It can be seen that there are features that are numeric and also objects. Later, the ones that are not numeric will have to be converted into either float or int in order to be plotted and then used for the training of the models. There are also missing values in the dataset, which will be handled later.

```
# Find columns with missing values and their percent missing
df.isnull().sum()
miss_val = df.isnull().sum().sort_values(ascending=False)
miss_val = pd.DataFrame(data=df.isnull().sum().sort_values(ascending=False), columns=['Missva'
# Add a new column to the dataframe and fill it with the percentage of missing values
miss_val['Percent'] = miss_val.MissvalCount.apply(lambda x : '{:.2f}'.format(float(x)/df.shap
miss_val = miss_val[miss_val.MissvalCount > 0].style.background_gradient(cmap='Reds')
miss_val
```

Loan_Status	367	37.41
Credit_History	79	8.05

MissvalCount Percent

Credit_mistory	19	0.03
Self_Employed	55	5.61
LoanAmount	27	2.75
Dependents	25	2 55

The light red color shows the small amount of NaN values. If the features were with a high than 50% of missing values, they would have to be removed. Yet, in this case, they have relatively low percentage so they can be used in future. Then, the NaN values will be replaced.

Sorting the data by Loan_Status and showing 50 elements.

                                  7583])
```

sns.countplot(y = 'Gender', hue = 'Loan Status', data = df)

<matplotlib.axes._subplots.AxesSubplot at 0x7ff9aa362890>

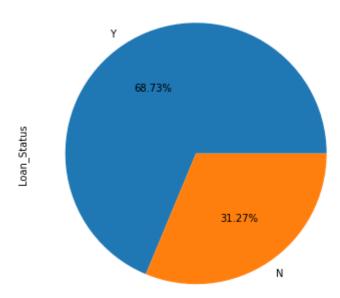

The diagram shows on one hand that there are more male applicants than female and on other hand, there are more approved loans than disapproved.

The percentage of males who applied for a loan is greater than the one of females.

df['Loan_Status'].value_counts().plot(kind='pie', autopct='%1.2f%%', figsize=(6, 6))

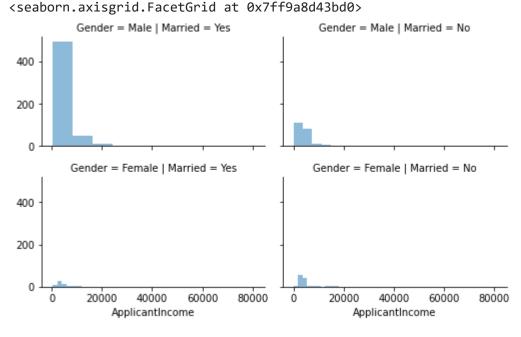

<matplotlib.axes._subplots.AxesSubplot at 0x7ff9a8d75c10>

According to the pie chart, there are more approved loans that disapproved.

```
grid=sns.FacetGrid(df, row='Gender', col='Married', size=2.2, aspect=1.6)
grid.map(plt.hist, 'ApplicantIncome', alpha=.5, bins=10)
grid.add_legend()
```

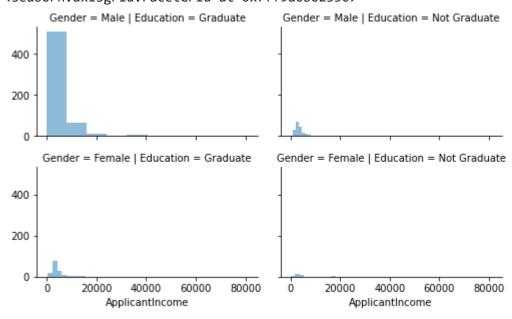

/usr/local/lib/python3.7/dist-packages/seaborn/axisgrid.py:316: UserWarning: The `size` warnings.warn(msg, UserWarning)

Males have the highest income according to the data. Males that are married have greater income than unmarried male. And the same goes for females.

```
grid=sns.FacetGrid(df, row='Gender', col='Education', size=2.2, aspect=1.6)
grid.map(plt.hist, 'ApplicantIncome', alpha=.5, bins=10)
grid.add_legend()
```

/usr/local/lib/python3.7/dist-packages/seaborn/axisgrid.py:316: UserWarning: The `size` warnings.warn(msg, UserWarning) <seaborn.axisgrid.FacetGrid at 0x7ff9a0b02350>

A graduate who is a male has more income than a one whithout and the same goes for females.

Here I am exploring the distribution of the numerical variables mainly the Applicant income and the Loan amount.

What can be noticed are quite a few outliers.

sns.distplot(df.ApplicantIncome,kde=False)

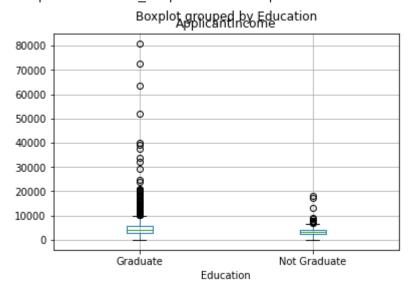

/usr/local/lib/python3.7/dist-packages/seaborn/distributions.py:2557: FutureWarning: `di warnings.warn(msg, FutureWarning) <matplotlib.axes. subplots.AxesSubplot at 0x7ff9a0909550>

300 -250 -

People with better education should normally have a higher income, we can check that by plotting the education level against the income.

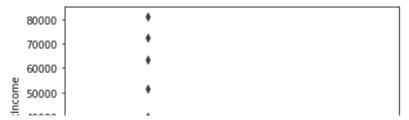

/usr/local/lib/python3.7/dist-packages/numpy/core/_asarray.py:83: VisibleDeprecationWarr
return array(a, dtype, copy=False, order=order)
<matplotlib.axes. subplots.AxesSubplot at 0x7ff9a0807090>

We can conclude that there is no substantial different between the mean income of graduate and non-graduates. However, there are a higher number of graduates with very high incomes, which are appearing to be the outliers.

sns.boxplot(x='Education',y='ApplicantIncome',data=df)

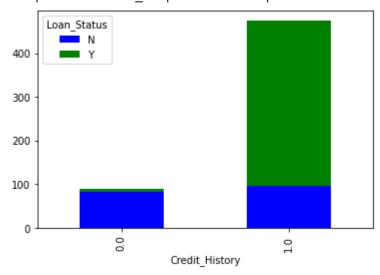

<matplotlib.axes._subplots.AxesSubplot at 0x7ff9a0730ad0>

The distributions shows that the graduates have more outliers which means that the people with huge income are most likely to be educated.

```
temp3 = pd.crosstab(df['Credit_History'], df['Loan_Status'])
temp3.plot(kind='bar', stacked=True, color=['blue', 'green'], grid=False)
```

<matplotlib.axes. subplots.AxesSubplot at 0x7ff9a0af6f50>

This shows that the chances of getting a loan are higher if the applicant has a valid credit history.

Data cleaning

Checking if there are any null values and if so, which.

df.isnull().sum()

Loan_ID	0
Gender	24
Married	3
Dependents	25
Education	0

```
Self Employed
                       55
ApplicantIncome
CoapplicantIncome
                        0
                       27
LoanAmount
                       20
Loan Amount Term
Credit History
                       79
Property Area
                        0
Loan_Status
                      367
dtype: int64
```

Converting the string values to numeric values to use them in the training of the models.

One-Hot Encoding: This process takes categorical variables and converts them to a numerical representation without an arbitrary ordering. What computers know is numbers and for machine learning it is vital to accommodate the feautures into numeric values.

```
numeric_gender = {'Female': 1, 'Male': 2}
df ['Gender'] = df['Gender'].map(numeric_gender)
numeric_married = {'Yes': 1, 'No': 2}
df ['Married'] = df['Married'].map(numeric_married)
numeric_edu = {'Graduate': 1, 'Not Graduate': 2}
df ['Education'] = df['Education'].map(numeric_edu)
numeric_self = {'Yes': 1, 'No': 2}
df ['Self_Employed'] = df['Self_Employed'].map(numeric_self)
numeric_loan = {'Y': 1, 'N': 2}
df ['Loan_Status'] = df['Loan_Status'].map(numeric_loan)
numeric_property = {'Rural': 1, 'Urban': 2, 'Semiurban': 3}
df ['Property_Area'] = df['Property_Area'].map(numeric_property)
numeric_d = {'3+': 3}
df ['Dependents'] = df['Dependents'].map(numeric_d)
```

Filling up the null values in order to train the model.

```
df.fillna(0)
```

	Loan_ID	Gender	Married	Dependents	Education	Self_Employed	ApplicantIncome
0	LP001015	2.0	1.0	0.0	1	2.0	5720
1	LP001022	2.0	1.0	0.0	1	2.0	3076
2	LP001031	2.0	1.0	0.0	1	2.0	5000
3	LP001035	2.0	1.0	0.0	1	2.0	2340
4	LP001051	2.0	2.0	0.0	2	2.0	3276

Data processing:

Checking if there are certain missing values that need to be fixed.

```
total = df.isnull().sum().sort_values(ascending=False)
percent = (df.isnull().sum()/df.isnull().count()).sort_values(ascending=False)
missing_data = pd.concat([total, percent], axis=1, keys=['Total', 'Percent'])
missing_data.head(20)
```

	Total	Percent
Dependents	890	0.907238
Loan_Status	367	0.374108
Credit_History	79	0.080530
Self_Employed	55	0.056065
LoanAmount	27	0.027523
Gender	24	0.024465
Loan_Amount_Term	20	0.020387
Married	3	0.003058
Property_Area	0	0.000000
CoapplicantIncome	0	0.000000
ApplicantIncome	0	0.000000
Education	0	0.000000
Loan_ID	0	0.000000

Filling the missing values, for categorical we can fill them with the mode (the value with the highest frequency). The best practice is to use mode with data points such as salary field or any other kind of money.

```
df['Gender'] = df['Gender'].fillna(
df['Gender'].dropna().mode().values[0] )
df['Married'] = df['Married'].fillna(
df['Married'].dropna().mode().values[0] )
df['Dependents'] = df['Dependents'].fillna(
df['Dependents'].dropna().mode().values[0] )
df['Self Employed'] = df['Self Employed'].fillna(
df['Self Employed'].dropna().mode().values[0] )
df['LoanAmount'] = df['LoanAmount'].fillna(
df['LoanAmount'].dropna().median() )
df['Loan Amount Term'] = df['Loan Amount Term'].fillna(
df['Loan Amount Term'].dropna().mode().values[0] )
df['Credit History'] = df['Credit History'].fillna(
df['Credit_History'].dropna().mode().values[0] )
df['Loan_Status'] = df['Loan_Status'].fillna(
df['Loan Status'].dropna().mode().values[0] )
```

Checking if there are still any empty values after the filling.

```
df.isnull().sum()
```

```
Loan ID
                      0
Gender
Married
Dependents
Education
                      0
Self Employed
                      0
ApplicantIncome
                      0
CoapplicantIncome
LoanAmount
Loan Amount Term
                      0
Credit History
                      0
Property Area
                      0
Loan Status
dtype: int64
```

Some people might have a low income, but strong CoappliantIncome, so a good idea would be to combine them in a TotalIncome column.

```
df['LoanAmount_log']=np.log(df['LoanAmount'])
df['TotalIncome']= df['ApplicantIncome'] + df['CoapplicantIncome']
df['TotalIncome_log']=np.log(df['TotalIncome'])
sns.distplot(df.TotalIncome,kde=False)
```
